

Customer Journey Map

Date	19 June 2026
Team ID	
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	• Accesses the live web application using a web browser. • Views the Dashboard Home Page. • Navigates to the Input Form page to check their local area's flood risk.	• Fills out the weather parameters in the Input Form (e.g., annual and seasonal rainfall data). • Submits the form data to the Flask backend application. • Waits a brief moment for the machine learning model to compute the results.	• Reviews the generated result page ("Flood Chance" or "No Flood Chance"). • Examines their Prediction History to see past recorded predictions. • Takes personal safety or disaster preparedness steps based on the output.
Touchpoint <i>What part of the service do they interact with?</i>	• Web Browser interface (HTML, CSS, JavaScript). • Home Page Dashboard UI.	• Input Form fields for weather and meteorological parameters. • Flask backend API endpoint handler (URL Mapping / Form Validation).	• Flood / No Flood Chance Result Page layout. • Prediction History layout screen.

Customer Thought <i>What is the customer thinking?</i>	• "Is my region safe from flooding based on recent heavy rainfall?" • "This application layout looks easy to navigate." • "Where do I input my local meteorological data?"	• "Will this application handle my inputs properly without crashing?" • "I hope the backend processes the weather data quickly." • "How accurate will this machine learning prediction really be?"	• "The accurate XGBoost prediction helps me understand my real risk profile." • "It is useful to see all my past prediction history saved here." • "I need to share these prediction details with local community members."
Customer Feeling <i>What is the customer feeling?</i>	* Curious about their regional climate safety risks. * Hopeful that the web application will be easy to fill out.	* Anxious to see the final calculated prediction result. * Expectant of high computational performance from the Flask framework.	* Informed and empowered to make disaster preparedness choices. * Confident in the machine learning system's verified accuracy score.
Process Ownership <i>Who is in the lead on this?</i>	Frontend Developers (UI/UX Team)	Backend Flask Developer & Data Engineers	Machine Learning Engineers & Deployment Operations
Opportunities <i>How can we improve this stage?</i>	• Provide explicit tooltip descriptions explaining each weather parameter to assist users. • Ensure the web dashboard layout automatically adapts smoothly to mobile browsers.	• Implement a real-time validation script to catch form errors before submission to Flask. • Add a loading spinner animation to indicate active model calculation	• Include a direct option to download the result summary as a PDF report. • Provide a feature to export the entire Prediction History list as an Excel file.
